Value-Based Health Care Delivery: Implications for the Taiwanese System

Professor Michael E. Porter
Harvard Business School

Koo Foundation, Sun Yat-Sen Cancer Center
April 9, 2010

Doctors Jason Wang and Andrew Huang, and Senior Researcher Jennifer Baron made a substantial contribution to this presentation. This presentation draws on Michael E. Porter and Elizabeth Olmsted Teisberg: Redefining Health Care: Creating Value-Based Competition on Results, Harvard Business School Press, May 2006, and "How Physicians Can Change the Future of Health Care," Journal of the American Medical Association, 2007; 297:1103:1111. No part of this publication may be reproduced, stored in a retrieval system, or transmitted in any form or by any means — electronic, mechanical, photocopying, recording, or otherwise — without the permission of Michael E. Porter and Elizabeth Olmsted Teisberg. Further information about these ideas, as well as case studies, can be found on the website of the Institute for Strategy & Competitiveness at http://www.isc.hbs.edu.
Redefining Health Care Delivery

• Universal coverage and access to care are essential, but not enough
• The core issue in health care is the value of health care delivered

Value: Patient health outcomes per dollar spent

• How to design a health care delivery system that dramatically improves patient value
  – Ownership of entities is secondary (e.g. non-profit vs. for profit vs. government)
• How to construct a dynamic system that keeps rapidly improving
Creating a Value-Based Health Care System

• Significant improvement in value will require **fundamental restructuring of health care delivery**, not incremental improvements

  Today, 21\textsuperscript{st} century medical technology is often delivered with 19\textsuperscript{th} century organization structures, management practices, measurement, and pricing

- Process improvements, care pathways, lean production, safety initiatives, disease management and other overlays to the current structure are beneficial but **not sufficient**

- “Consumers” **cannot fix the dysfunctional structure** of the current system
Creating Competition on Value

• **Competition for patients/subscribers** is a powerful force to encourage restructuring of care and continuous improvement in value

• Today’s competition in health care is **not aligned with value**

- Financial success of system participants ≠ Patient success

• Creating positive-sum **competition on value** is a central challenge in health care reform in every country
The central goal in health care must be **value for patients**, not access, equity, volume, convenience, or cost containment

Value = \[
\frac{\text{Health outcomes}}{\text{Costs of delivering the outcomes}}
\]

• Outcomes are the **full set of patient health outcomes** over the care cycle

• Costs are the **total costs of care for the patient’s condition**, not just the cost of a single provider or a single service
Principles of Value-Based Health Care Delivery

**Quality improvement** is the key driver of cost containment and higher value, where quality is **health outcomes**

- Prevention
- Early detection
- Right diagnosis
- Right treatment to the right patient
- Early and timely treatment
- Treatment earlier in the causal chain of disease
- Rapid cycle time of diagnosis and treatment
- Less invasive treatment methods
- Fewer complications
- Fewer mistakes and repeats in treatment
- Faster recovery
- More complete recovery
- Less disability
- Fewer relapses or acute episodes
- Slower disease progression
- Less need for long term care
- Less care induced illness

- **Better health** is the goal, not more treatment
- Better health is **inherently less expensive** than poor health
Cost versus Quality, Sweden
Health Care Spending by County, 2008

Note: Cost including; primary care, specialized somatic care, specialized psychiatry care, other medical care, political health- and medical care activities, other subsidies (e.g. drugs)
Source: Öpna jämförelser, Socialstyrelsen 2008; Sjukvårdsdata i fokus 2008; BCG analysis
Value-Based Health Care Delivery
The Strategic Agenda

1. Organize into Integrated Practice Units around the Patient’s Medical Condition (IPUs)
   - Including primary and preventive care for distinct patient populations

2. Measure Outcomes and Cost for Every Patient

3. Move to Bundled Prices for Care Cycles

4. Integrate Care Delivery Across Separate Facilities

5. Grow by Expanding Excellent IPUs Across Geography

6. Create an Enabling Information Technology Platform
1. Organize Into Integrated Practice Units

Care delivery should be organized around the patient’s medical condition over the full cycle of care.

- A medical condition is an interrelated set of patient medical circumstances best addressed in an integrated way:
  - Defined from the patient’s perspective
  - Including the most common co-occurring conditions and complications
  - Involving multiple specialties and services

- The patient’s medical condition is the unit of value creation in health care delivery.
1. Organize into Integrated Practice Units
Migraine Care in Germany

Existing Model:
Organize by Specialty and Discrete Services

1. Organize into Integrated Practice Units
Migraine Care in Germany

Existing Model:
Organize by Specialty and Discrete Services

New Model:
Organize into Integrated Practice Units (IPUs)

- **Breast Cancer Specialist**
- **Other Provider Entities**
# Integrating Across the Cycle of Care: Breast Cancer

## Informing and Engaging
- Advice on self-screening
- Consultations on risk factors
- Counseling patient and family on the diagnostic process and the diagnosis
- Explaining patient treatment options/Shared decision making
- Patient and family psychological counseling
- Counseling on the treatment process
- Education on managing side effects and avoiding complications of treatment
- Achieving compliance
- Psychological counseling
- Counseling on long-term risk management
- Achieving Compliance

## Measuring
- **Self exams**
- **Mammograms**
  - Mammograms
  - Ultrasound
  - MRI
  - Labs (CBC, etc.)
  - Blood chems,
  - Biopsy
  - BRACA 1, 2...
  - CT
  - Bone Scans
- Labs
- Procedure-specific measurements
- Range of movement
- Side effects measurement
- MRI, CT
- Recurring mammograms (every six months for the first 3 years)

## Accessing
- **Office visits**
- **Mammography lab visits**
- **Office visits**
- **Hospital stays**
- **Office visits**
- **Office visits**
- **Lab visits**
- **Hospital visits**
- **Lab visits**
- **High risk clinic visits**
- **Visits to outpatient radiation or chemotherapy units**
- **Pharmacy**
- **Rehabilitation facility visits**
- **Mammographic labs and imaging center visits**

## Monitoring/Preventing
- **Medical history**
- Control of risk factors (obesity, high fat diet)
- Genetic screening
- Clinical exams
- Monitoring for lumps

## Diagnosing
- Medical history
- Determining the specific nature of the disease (mammograms, pathology, biopsy results)
- Genetic evaluation
- Labs

## Preparing
- Choosing a treatment plan
- Surgery prep (anesthetic risk assessment, EKG)
- Plastic or onco-plastic surgery evaluation
- Neo-adjuvant chemotherapy

## Intervening
- Surgery (breast preservation or mastectomy, oncoplastic alternative)
- Adjuvant therapies (hormonal medication, radiation, and/or chemotherapy)

## Recovering/Rehabing
- In-hospital and outpatient wound healing
- Treatment of side effects (e.g., skin damage, cardiac complications, nausea, lymphedema and chronic fatigue)

## Monitoring/Managing
- Periodic mammography
- Other imaging
- Follow-up clinical exams
- Treatment for any continued or later onset side effects or complications

- Physical therapy

- Breast Cancer Specialist

- Other Provider Entities

IPUs and Value

- **Better decisions** in terms of diagnosis and treatment
  - Specialized experience and expertise
  - Better coordination/peer review
  - Better integration of co-occurrences
- **Better execution** of treatment
  - Specialized experience and expertise
  - Tailored facilities
  - Seamless management of common co-occurrences
- **Faster** cycle time
- Improved **patient compliance and engagement** with care
- Full range of **support services** needed to achieve success for the patient (e.g., nutrition, rehabilitation, counseling, psychological support)
- Vastly greater patient **convenience**

- Greater provider efficiency
- Better utilization of facilities
- Streamlined administrative costs
Coordinating Care Across IPUs
Patients with Multiple Medical Conditions

- The primary organizational structure for care delivery should be around the forms of integration required for every patient, or IPUs
  - The current system is organized around the exception, not the rule
- Overlay mechanisms should manage coordination across IPUs
- The IPU model will greatly simplify coordination of care for patients with multiple medical conditions

**Integrated Diabetes Unit**

**Integrated Cardiac Care Unit**

**Integrated Breast Cancer Unit**

**Integrated Osteoarthritis Unit**
Volume and experience have an even greater impact on value in an IPU structure than in the current system.
## Fragmentation of Hospital Services
### Japan

2. Measure Outcomes and Cost For Every Patient

- **Patient Initial Conditions**
- **Processes/Activities**
  - Protocols/Guidelines
- **Indicators**
  - E.g., Hemoglobin A1c levels for diabetics
- **(Health) Outcomes**
The Outcome Measures Hierarchy

Tier 1
Health Status Achieved
- Survival

Tier 2
Process of Recovery
- Degree of health/recovery
- Time to recovery or return to normal activities
- Disutility of care or treatment process (e.g., discomfort, complications, adverse effects, errors, and their consequences)

Tier 3
Sustainability of Health
- Sustainability of health or recovery and nature of recurrences
- Long-term consequences of therapy (e.g., care-induced illnesses)
The Outcome Measures Hierarchy

Breast Cancer

- Survival
  - Survival rate (One year, three year, five year, longer)
- Degree of recovery / health
  - Degree of remission
  - Functional status
  - Breast conservation
  - Depression
- Time to recovery or return to normal activities
  - Time to remission
  - Time to functional status
- Disutility of care or treatment process (e.g., treatment-related discomfort, complications, adverse effects, diagnostic errors, treatment errors)
  - Nosocomial infection
  - Nausea/vomiting
  - Febrile neutropenia
  - Suspension of therapy
  - Failed therapies
  - Limitation of motion
  - Depression
- Sustainability of recovery or health over time
  - Cancer recurrence
  - Sustainability of functional status
  - Incidence of secondary cancers
  - Brachial plexopathy
  - Fertility/pregnancy complications
  - Premature osteoporosis
- Initial Conditions/Risk Factors
  - Stage of disease
  - Type of cancer (infiltrating ductal carcinoma, tubular, medullary, lobular, etc.)
  - Estrogen and progesterone receptor status (positive or negative)
  - Sites of metastases
  - Previous treatments
  - Age
  - Menopausal status
  - General health, including co-morbidities
  - Psychological and social factors
Adult Kidney Transplant Outcomes,
U.S. Center Results, 1987-1989

Number of programs: 219
Number of transplants: 19,588
1 year graft survival 79.6%

16 greater than predicted survival (7%)
20 worse than predicted survival (10%)
Adult Kidney Transplant Outcomes, U.S. Center Results, 1998-2000

1 year graft survival 90.9%
- 10 greater than predicted survival (4.5%)
- 14 worse than predicted survival (6.4%)
Adult Kidney Transplant Outcomes
U.S. Center Results, 2005-2007

Number of programs: 240
Number of transplants: 38,515
1 year graft survival: 93.2%

- 16 greater than expected graft survival (6.6%)
- 19 worse than expected graft survival (7.8%)
Measuring Cost

Aspiration

• Cost should be measured for each patient, aggregated across the full cycle of care
• Cost should be measured for each medical condition (which includes common co-occurring conditions), not for all services
• The cost of each activity or input attributed to a patient should reflect that patient’s use of resources (e.g. time, facilities, supplies, services), not average allocations
• The only way to properly measure true cost per patient is to track the time devoted to each patient by providers, facilities, support services, and other shared costs

Reality

• Most providers track charges not costs
• Most providers track cost by billing category, not for medical conditions
• Most providers cannot accumulate total costs for particular patients
• Most providers use arbitrary or average allocation of shared resources, not patient specific allocations
3. Move to Bundled Prices for Care Cycles

- Fee for service
- Bundled reimbursement for medical conditions
- Global capitation
- Global budgeting
What is Bundled Payment?

- **Total package price** for the care cycle for a medical condition
  - Includes responsibility for **avoidable complications**
  - Medical condition capitation
- The bundled price should be **severity adjusted**

**What is Not Bundled Payment**

- Prices for **short** episodes (e.g. inpatient only, procedure only)
- **Separate** payments for physicians and facilities
- **Pay-for-performance** bonuses
- “**Medical Home**” payment for care coordination

- DRGs can be a **starting point** for bundled models
Bundled Payment in Practice
Hip and Knee Replacement in Sweden

- In 2009, Stockholm County Council began to offer a **bundled price for joint replacement** (hip and knee), that includes:
  - Pre-op evaluation
  - Lab tests
  - Radiology
  - Surgery & related admission
  - Prosthesis
  - Drugs
  - Inpatient rehab, up to 6 days
  - 1 follow-up visit within 3 months
  - Any additional surgery to the joint within 2 years
  - If post-op infection requiring antibiotics occurs, guarantee extended to 5 years

- **Same referral** system from primary care
- Eligibility is restricted to **relatively healthy patients** (i.e. ASA scores of 1 or 2)
- The bundled price for a knee or hip replacement is about **US $8,000**
- **Mandatory** reporting to joint registry plus supplementary
- Provider participation is **voluntary** but all providers are involved
  - 6 public hospitals, 4 private hospitals
  - 3400 patients treated in 2009
4. Integrate Care Delivery Across Separate Facilities

Children’s Hospital of Philadelphia (CHOP)
Hospital Affiliates
Levels of System Integration

1. **Rationalize service lines/IPUs** across facilities to improve volume, avoid duplication, play to strength, and concentrate excellence

2. Offer specific services at the **appropriate facility**
   - E.g. acuity level, cost level, need for convenience
   - Patient referrals across units

3. Clinically integrate care **across facilities**, within an IPU structure
   - Develop consistent protocols and provide access to experts by providers throughout the network
   - **Expand coverage** of the care cycle and **integrate care** across the cycle
   - Connecting **ancillary service** units to IPUs
     - E.g. home care, rehabilitation, behavioral health, social work, addiction treatment (organize within service units to align with IPUs)
   - Linking **preventive/primary care** units to specialty IPUs
5. Grow by Expanding Excellent IPUs Across Geography

The Cleveland Clinic Managed Practices

- Swedish Medical Center, WA
  Cardiac Surgery

- Rochester General Hospital, NY
  Cardiac Surgery

- Cape Fear Valley Health System, NC
  Cardiac Surgery

- Chester County Hospital, PA
  Cardiac Surgery

- Cleveland Clinic Florida Weston, FL
  Cardiac Surgery

- CLEVELAND CLINIC
  Cardiac Care

- The Cleveland Clinic Managed Practices

Grow in ways that improve **value**, not just volume
Models of Geographic Expansion

AFFILIATIONS

- Affiliation Agreements with Independent Provider Organizations
- Second Opinions and Telemedicine Services

NODES

- Dispersed Diagnostic Centers
- Convenience Sensitive Service Locations in the Community
- Complex IPU Components (e.g. surgery) in Additional Locations

HUBS

- Specialty Referral Hospitals in Additional Locations
- Broader-Line Referral Hubs
6. Create an Enabling Information Technology Platform

Utilize information technology to enable restructuring of care delivery and measuring results, rather than treating it as a solution itself

- Common data definitions
- Combine all types of data (e.g. notes, images) for each patient over time
- Data encompasses the full care cycle, including referring entities
- Allowing access and communication among all involved parties, including patients
- “Structured” data vs. free text
- Templates for medical conditions to enhance the user interface
- Architecture that allows easy extraction of outcome, process, and cost measures
- Interoperability standards enabling communication among different provider systems
A Mutually Reinforcing Strategic Agenda

- Organize into Integrated Practice Units
- Integrate Care Delivery Across Separate Facilities
- Measure Outcomes and Cost For Every Patient
- Grow Excellent Services Across Geography
- Move to Bundled Prices for Care Cycles
- Enabling IT Platform
Value-Based Healthcare Delivery: Implications for Contracting Parties/Health Plans

“Payor”

Value-Added Health Organization
Value-Adding Roles of Health Plans

Members
• Assemble, analyze, and manage the total medical records of members
• Contract for integrated prevention, wellness, screening, and disease management services for defined member segments

Providers
• Design new bundled reimbursement structures for care cycles instead of fees for discrete services
• Encourage and reward integrated practice unit models by providers
• Assist in coordinating patient care across care cycles and across medical conditions

Evaluation
• Monitor and compare provider results by medical condition
• Provide advice to patients (and referring physicians) in selecting excellent providers
• Measure and report member health results by medical condition versus other plans

• Health plans will require new staff and new capabilities to play these roles
Value-Based Health Care Delivery: Implications for Government

- Remove obstacles to the restructuring of health care delivery around the integrated care of medical conditions
- Establish universal measurement and reporting of provider health outcomes
- Require universal reporting by health plans of health outcomes for members
- Shift reimbursement systems to bundled prices for cycles of care instead of payments for discrete treatments or services
- Open up competition among providers and across geography
- Mandate EMR adoption that enables integrated care and supports outcome measurement
  - National standards for data definitions, communication, and aggregation
  - Software as a service model for smaller providers
- Encourage greater responsibility of individuals for their health and their health care
Moving to a High Value Health Care System in Taiwan

Strengths

Insurance and Coverage

- **Universal**, mandatory health insurance coverage
- **Income-based** payroll taxes ("premiums") and employer contributions
  - Low-income residents exempt from premiums and cost sharing
- National fee-for-service payment schedule **eliminates price discrimination** across patients
- Coverage and reimbursement for a **wide scope of benefits**, including primary and preventive care

Delivery System

- **Free choice** of providers
- Most hospital physicians are **salaried**
- Widespread adoption of **health information technology**, including "Smart card," electronic health record systems, electronic claims submission
- Initial steps toward **measuring results**, e.g. disease registries and pay-for-performance reporting requirements
- Initial steps toward **bundled reimbursement at the medical condition level** for breast cancer

- Health care expenditures are relatively **low** compared to other health care systems with universal coverage
  - Achieved without rationing of care or long wait times
Moving to a High Value Health System in Taiwan

Weaknesses

Delivery System

- Focus is primarily on access rather than value improvement for patients
- Government payer is largely passive, missing opportunities to contribute to member health
  - No mechanisms for directing patients to appropriate and excellent providers
- Focus is on interventions rather than integrated care across the care cycle
- Lack of effective primary and preventative care and disease management
- Hospital-centric care delivery system
- Duplication and fragmentation of services across providers
- Inefficient use of physicians
- Weak coordination of care
- Lack of comprehensive outcome measurement
- Fee-for-service reimbursement and global budget “point” system are misaligned with value, encouraging over-provision of services
  - Although most physicians are salaried, a larger part of their compensation is based on a volume driven bonus
- Limited engagement of patients in their health and health care
Moving to a High Value Health Care System in Taiwan

Recommendations

Insurance and Coverage

• Move from a passive payer model to a true health plan model in which the BNHI assists members in managing their health

• The BNHI should measure and report the health outcomes of members by medical condition, stratified by risk

• Encourage greater responsibility of individuals for their health
  – E.g. through incentives for healthy behavior and co-payments that encourage use of high value services and adherence to healthy behaviors, medications, and treatment regimens
Moving to a High Value Health Care System in Taiwan
Recommendations, cont’d.

**Delivery System**

- **Require mandatory measurement of patient health outcomes** by medical condition for every provider, beginning with prevalent diseases
  - Including *outcomes for primary/preventive care*, for defined populations
- **Shift reimbursement to bundled prices for cycles of care** instead of payment for discrete services
  - Accelerate the roll-out of the *modified Taiwan DRG system*
  - Build upon of the *bundled payment mode* for breast cancer
  - Bundled prices should include *high value care* services and responsibility for unnecessary complications
  - Bundles should be *severity adjusted* for member health differences to minimize bias against complex patients
  - Prices should move to *price caps* instead of fixed prices over time once universal outcome measurement is in place
  - Over time, the *global budgets* and the “point” system should be eliminated
    - Results measurement will reduce duplicative and unnecessary care and determine whether over-provision is occurring
Moving to a High Value Health Care System in Taiwan
Recommendations, cont’d.

Delivery System, cont’d.

• Enable integrated care delivery structures for medical conditions, which encompass the full care cycle
  – Multidisciplinary and outpatient centric
  – Expanding non-physician skilled staff, and emphasizing patient education and engagement
  – Involving affiliations with primary care units

• Create new integrated primary and preventive care models for defined patient groups

• Open competition on value among providers

• Consider minimum volume standards for certification in more complex medical conditions, pending universal outcome measurement

• Reduce barriers and create incentives for excellent providers to expand across multiple locations, including local feeder facilities with telemedicine support for rural areas

• Mandate national, interoperable EMR adoption enabling integrated care and supporting outcome measurement within and across provider settings
  – Set IT standards for data definitions, data architecture, and interoperability, and set a fixed deadline within which all medical information systems must be compliant
Harvard ISC Invitation for Collaboration

- Curriculum on value-based health care delivery
